Understanding this Document

The layout you choose to suspend your baffles in, will have an impact on their performance. The tests on the following pages will show how density, spacing and suspension height effect acoustic performance, allowing you to optimize your design accordingly.

The key figure to look for is 'Array NRC.' This is the NRC (Noise Reduction Coefficient) value of the panel when placed in the particular array situation. Compare this to the panel's NRC when hanging by itself and you'll see the benefits of certain array layouts over others.

General Principles

- Density: The number of baffles in a given area will determine the rate of sound absorption. This can vary depending on room size and noise levels.
- Pattern: Spread evenly for general sound control or alternate panel direction to absorb sound waves moving in multiple directions. Using a grid like 'tic-tac-toe' layout will improve the performance as more random energy will be absorbed in the room. Suspending the baffles in both X and Y axes will capture noise in both directions.
- Suspension Height: Leave a minimum 3" (76mm) of air space between the panel and ceiling, up to a maximum of 75" (150cm). Panels can be suspended horizontally or vertically.

Array Variations

Array 1 (Pages 3-12)

Broadway Saturna LP Baffles 48 x 12 x 1.5" (1,219 x 305 x 38mm) 2x6 grid, 12" (305mm) between rows 12" (305mm) between panels in row Suspended 41.5" (1,054mm) from the ceiling

RAL[™]A24-479 Test

Array-NRC: 0.95 over 67.38ft² (6.26m²) of extended continuous surface area

Array 2 (Pages 13-22)

Broadway Saturna Baffles 48 x 12 x 1.5" (1,219 x 305 x 38mm) 2x6 grid, 32" (813mm) between rows 15" (381mm) between panels in row Suspended 42.25" (1,073mm) from the ceiling RAL[™]A24-471 Test

Array-NRC: 0.45 over 175.45ft² (16.3m²) of extended continuous surface area

Sound Absorption <u>RALTM-A24-479</u>

SPONSOR: Radial Engineering Port Coquitlam, BC, Canada

CONDUCTED: 2024-12-13

ON: Primacoustic - Saturna LP Baffles Fabric Finish (12 objects, 6 rows of 2 objects each, rows spaced 12" apart, objects in each row spaced 12" apart)

TEST METHODOLOGY

Riverbank Acoustical Laboratories[™] is accredited by the U.S. Department of Commerce, National Institute of Standards and Technology (NIST) under the National Voluntary Laboratory Accreditation Program (NVLAP) as an ISO 17025:2017 Laboratory (NVLAP Lab Code: 100227-0) and for this test procedure. The test reported in this document conformed explicitly with ASTM C423-23: "Standard Test Method for Sound Absorption and Sound Absorption Coefficients by the Reverberation Room Method." The specimen mounting was performed according to ASTM E795-23: "Standard Practices for Mounting Test Specimens During Sound Absorption Tests." A description of the measurement procedure and room specifications are available upon request. The results presented in this report apply to the sample as received from the test sponsor.

INFORMATION PROVIDED BY SPONSOR

The test specimen was designated by the sponsor as Primacoustic - Saturna LP Baffles Fabric Finish (12 objects, 6 rows of 2 objects each, rows spaced 12" apart, objects in each row spaced 12" apart). The following nominal product information was provided by the sponsor prior to testing. The accuracy of such sponsor-provided information can affect the validity of the test results.

Product Under Test

Product Name: Primacoustic - Saturna LP Baffles Fabric Finish Manufacturer: Radial Engineering

SPECIMEN MEASUREMENTS & TEST CONDITIONS

Through a full external visual inspection performed on the test specimen, Riverbank personnel verified the following information:

Test Specimen

Product Type:BafflesDimensions:12 baffles @ 39.24 mm (1.545 in.) wide by 1219 mm (48 in.) longDepth:305 mm (12 in.)Overall Weight:22.45 kg (49.5 lbs)

(B) RIVERBANK ACOUSTICAL LABORATORIES IS ACCREDITED BY NVLAP (LAB CODE 100227-0) FOR ACOUSTICAL TESTING SERVICES IN ACCORDANCE WITH ISO/IEC 17025:2017 AND FOR THIS PROCEDURE. THIS REPORT MUST NOT BE USED BY THE CLIENT TO CLAIM PRODUCT CERTIFICATION, APPROVAL, OR ENDORSEMENT BY RAL, NVLAP, NIST, OR ANY AGENCY OF THE U.S. GOVERNMENT. THIS REPORT SHALL NOT BE MODIFIED WITHOUT THE WRITTEN APPROVAL OF RAL. THE RESULTS REPORTED APPLY ONLY TO THE SPECIFIC SAMPLE SUBMITTED FOR TESTING; RAL ASSUMES NO RESPONSIBILITY FOR THE PERFORMANCE OF ANY OTHER SAMPLE.

<u>RAL^{тм}-A24-479</u> Page 2 of 9

Physical Measurements	(per	object)
------------------------------	------	---------

Dimensions:	0.3 m (12.0 in) wide by 1.22 m (48.0 in) long
Thickness:	0.04 m (1.545 in)
Weight:	1.87 kg (4.12 lbs)

i est Environment

Room Volume:	291.98 m ³
Temperature:	21.2 °C \pm 0.1 °C (Requirement: \geq 10 °C and \leq 5 °C change)
Relative Humidity:	$60.9 \% \pm 0.4 \%$ (Requirement: $\ge 40 \%$ and $\le 5 \%$ change)
Barometric Pressure:	100.7 kPa (Requirement not defined)

Each sound absorbing object had an exposed surface area of 0.863 m² (9.29 ft²). The total exposed surface area of all sound-absorbing objects was 10.4 m² (111 ft²).

MOUNTING METHOD

Type JV-MOD Mounting: The specimen is an array of 12 spaced sound absorbing objects suspended from cables such that the closest face is located approximately 1054 mm (41.5 in.) from the horizontal test surface. This approximates the mounting method of a typical ceiling baffle installation. The objects were distributed in six rows of two objects each, with rows spaced 813 mm (32 in.) apart and objects in each row spaced 381 mm (15 in.) apart. The width of the installed object array was 1749 mm (68.875 in.) and the length of the installed object array was 2743 mm (108 in.). The area of extended continuous surface attributed to the object array was 6.26 m^2 (67.4 ft²).

TEST RESULTS

The preferred presentation of sound absorption test results for arrays of spaced objects is sound absorption (m^2) per object and total sound absorption (m^2) at each one-third-octave band

ASTM C423-23 Appendix X2 allows calculation of sound absorption per m^2 (SA/m²) based on the projected horizontal surface area attributable to an array of objects. The extended continuous surface area used in this calculation is to be determined using the following procedure:

 $S_{array} = (w + w_1) \times (l + l_1)$ If the set of objects consists of a rectangular array of equal sized objects with equal space between each object in a row and equal space between rows. (ASTM E423-23 X.2.3.1)

Where:

 S_{array} = area of extended continuous surface attributed to the test specimen, m² w = the measured width of the installed object array, in meters w_l = the space between objects in the array along the width, in meters l = the measured length of the installed object array, in meters l_l = the space between objects in the array along the length, in meters

The sound absorption per m^2 (SA/m²) is calculated based on the following formula:

$$\alpha_{array} = (A_2 - A_1)/S_{array}$$

Where:

 α_{array} = sound absorption per m² (SA/m²) of extended continuous surface, no units, A₁ = absorption of the empty reverberation room, m² and A₂ = absorption of the room after the specimen has been installed, m². S_{array} = area of extended continuous surface attributed to the test specimen, m²

Tested by Report by Approved by Marc Sciaky Eric P. Wolfram Keith Kimberling Senior Experimentalist Test Engineer Laboratory Manager

Note: Sound absorption per m^2 (SA/ m^2), and therefore the reported Single Number Ratings, are highly dependent on the exact sample shape, size, spacing, and extended continuous surface area present in the test and subsequent calculations. Changes to any of these parameters will change the resulting values. These presented results are valid only for the specific configuration present in this test.

Physical Measurements (per object)

Dimensions:	0.3 m (12.0 in) wide by 1.22 m (48.0 in) long
Thickness:	0.04 m (1.545 in)
Weight:	1.87 kg (4.12 lbs)

Test Environment	
-------------------------	--

Room Volume:	291.98 m ³
Temperature:	21.2 °C \pm 0.1 °C (Requirement: \geq 10 °C and \leq 5 °C change)
Relative Humidity:	$60.45 \% \pm 1.5 \%$ (Requirement: $\ge 40 \%$ and $\le 5 \%$ change)
Barometric Pressure:	98.3 kPa (Requirement not defined)

Each sound absorbing object had an exposed surface area of 0.863 m² (9.29 ft²). The total exposed surface area of all sound-absorbing objects was 10.4 m² (111 ft²).

MOUNTING METHOD

Type JV-MOD Mounting: The specimen is an array of 12 spaced sound absorbing objects suspended from cables such that the closest face is located approximately 1073 mm (42.25 in.) from the horizontal test surface. This approximates the mounting method of a typical ceiling baffle installation. The objects were distributed in six rows of two objects each, with rows spaced 813 mm (32 in.) apart and objects in each row spaced 381 mm (15 in.) apart. The width of the installed object array was 4283 mm (168.625 in.) and the length of the installed object array was 2819 mm (111 in.). The area of extended continuous surface attributed to the object array was 16.3 m² (176 ft²).

TEST RESULTS

The preferred presentation of sound absorption test results for arrays of spaced objects is sound absorption (m^2) per object and total sound absorption (m^2) at each one-third-octave band

ASTM C423-23 Appendix X2 allows calculation of sound absorption per m^2 (SA/m²) based on the projected horizontal surface area attributable to an array of objects. The extended continuous surface area used in this calculation is to be determined using the following procedure:

 $S_{array} = (w + w_1) \times (l + l_1)$ If the set of objects consists of a rectangular array of equal sized objects with equal space between each object in a row and equal space between rows. (ASTM E423-23 X.2.3.1)

Where:

 S_{array} = area of extended continuous surface attributed to the test specimen, m² w = the measured width of the installed object array, in meters w_l = the space between objects in the array along the width, in meters l = the measured length of the installed object array, in meters l_l = the space between objects in the array along the length, in meters

The sound absorption per m^2 (SA/m²) is calculated based on the following formula:

$$\alpha_{array} = (A_2 - A_1)/S_{array}$$

Where:

 α_{array} = sound absorption per m² (SA/m²) of extended continuous surface, no units, A₁ = absorption of the empty reverberation room, m² and A₂ = absorption of the room after the specimen has been installed, m². S_{array} = area of extended continuous surface attributed to the test specimen, m²

Tested by Report by Approved by Marc Sciaky Eric P. Wolfram Keith Kimberling Senior Experimentalist Test Engineer Laboratory Manager

Note: Sound absorption per m^2 (SA/ m^2), and therefore the reported Single Number Ratings, are highly dependent on the exact sample shape, size, spacing, and extended continuous surface area present in the test and subsequent calculations. Changes to any of these parameters will change the resulting values. These presented results are valid only for the specific configuration present in this test.

ON: Primacoustic - Saturna LP Baffles Paintable Finish (12 objects, 6 rows of 2 objects each, rows spaced 12" apart, objects in each row spaced 12" apart)

TEST METHODOLOGY

Riverbank Acoustical Laboratories[™] is accredited by the U.S. Department of Commerce, National Institute of Standards and Technology (NIST) under the National Voluntary Laboratory Accreditation Program (NVLAP) as an ISO 17025:2017 Laboratory (NVLAP Lab Code: 100227-0) and for this test procedure. The test reported in this document conformed explicitly with ASTM C423-23: "Standard Test Method for Sound Absorption and Sound Absorption Coefficients by the Reverberation Room Method." The specimen mounting was performed according to ASTM E795-23: "Standard Practices for Mounting Test Specimens During Sound Absorption Tests." A description of the measurement procedure and room specifications are available upon request. The results presented in this report apply to the sample as received from the test sponsor.

INFORMATION PROVIDED BY SPONSOR

The test specimen was designated by the sponsor as Primacoustic - Saturna LP Baffles Paintable Finish (12 objects, 6 rows of 2 objects each, rows spaced 12" apart, objects in each row spaced 12" apart). The following nominal product information was provided by the sponsor prior to testing. The accuracy of such sponsor-provided information can affect the validity of the test results.

Product Under Test

Product Name: Primacoustic - Saturna LP Baffles Paintable Finish Manufacturer: Radial Engineering

SPECIMEN MEASUREMENTS & TEST CONDITIONS

Through a full external visual inspection performed on the test specimen, Riverbank personnel verified the following information:

Test Specimen

Product Type:BafflesDimensions:12 baffles @ 40.98 mm (1.6135 in.) wide by 1219 mm (48 in.) longDepth:305 mm (12 in.)Overall Weight:26.54 kg (58.5 lbs)

TEST RESULTS

The preferred presentation of sound absorption test results for arrays of spaced objects is sound absorption (m^2) per object and total sound absorption (m^2) at each one-third-octave band

ASTM C423-23 Appendix X2 allows calculation of sound absorption per m^2 (SA/m²) based on the projected horizontal surface area attributable to an array of objects. The extended continuous surface area used in this calculation is to be determined using the following procedure:

 $S_{array} = (w + w_1) \times (l + l_1)$ If the set of objects consists of a rectangular array of equal sized objects with equal space between each object in a row and equal space between rows. (ASTM E423-23 X.2.3.1)

Where:

 S_{array} = area of extended continuous surface attributed to the test specimen, m² w = the measured width of the installed object array, in meters w_l = the space between objects in the array along the width, in meters l = the measured length of the installed object array, in meters l_l = the space between objects in the array along the length, in meters

The sound absorption per m^2 (SA/m²) is calculated based on the following formula:

$$\alpha_{array} = (A_2 - A_1)/S_{array}$$

Where:

 α_{array} = sound absorption per m² (SA/m²) of extended continuous surface, no units, A₁ = absorption of the empty reverberation room, m² and A₂ = absorption of the room after the specimen has been installed, m². S_{array} = area of extended continuous surface attributed to the test specimen, m²

Test Report

SPONSOR: Radial Engineering

Port Coquitlam, BC, Canada

CONDUCTED: 2024-12-11

ON: Primacoustic - Saturna LP Baffles Paintable Finish (12 objects, 6 rows of 2 objects each, rows spaced 32" apart, objects in each row spaced 15" apart)

TEST METHODOLOGY

Riverbank Acoustical Laboratories[™] is accredited by the U.S. Department of Commerce, National Institute of Standards and Technology (NIST) under the National Voluntary Laboratory Accreditation Program (NVLAP) as an ISO 17025:2017 Laboratory (NVLAP Lab Code: 100227-0) and for this test procedure. The test reported in this document conformed explicitly with ASTM C423-23: "Standard Test Method for Sound Absorption and Sound Absorption Coefficients by the Reverberation Room Method." The specimen mounting was performed according to ASTM E795-23: "Standard Practices for Mounting Test Specimens During Sound Absorption Tests." A description of the measurement procedure and room specifications are available upon request. The results presented in this report apply to the sample as received from the test sponsor.

INFORMATION PROVIDED BY SPONSOR

The test specimen was designated by the sponsor as Primacoustic - Saturna LP Baffles Paintable Finish (12 objects, 6 rows of 2 objects each, rows spaced 32" apart, objects in each row spaced 15" apart). The following nominal product information was provided by the sponsor prior to testing. The accuracy of such sponsor-provided information can affect the validity of the test results.

Product Under Test

Product Name: Primacoustic - Saturna LP Baffles Paintable Finish Manufacturer: Radial Engineering

SPECIMEN MEASUREMENTS & TEST CONDITIONS

Through a full external visual inspection performed on the test specimen, Riverbank personnel verified the following information:

Test Specimen

Product Type:BafflesDimensions:12 baffles @ 40.98 mm (1.6135 in.) wide by 1219 mm (48 in.) longDepth:305 mm (12 in.)Overall Weight:26.54 kg (58.5 lbs)

SPECIMEN MEASUREMENTS & TEST CONDITIONS (continued)

www.riverbankacoustics.com

FOUNDED 1918 BY WALLACE CLEMENT SABINE

RAL^{тм}-A24-472 Page 2 of 9

Physical Measurements (per object)

Dimensions: 0.3 m (12.0 in) wide by 1.22 m (48.0 in) long Thickness: 0.04 m (1.6135 in) Weight: 2.21 kg (4.87 lbs)

Test Environment

Room Volume:	291.98 m ³
Temperature:	21.1 °C \pm 0.1 °C (Requirement: \geq 10 °C and \leq 5 °C change)
Relative Humidity:	$56.25 \% \pm 0.3 \%$ (Requirement: $\ge 40 \%$ and $\le 5 \%$ change)
Barometric Pressure:	98.3 kPa (Requirement not defined)

Each sound absorbing object had an exposed surface area of 0.868 m² (9.34 ft²). The total exposed surface area of all sound-absorbing objects was 10.4 m² (112 ft²).

MOUNTING METHOD

Type JV-MOD Mounting: The specimen is an array of 12 spaced sound absorbing objects suspended from cables such that the closest face is located approximately 1067 mm (42 in.) from the horizontal test surface. This approximates the mounting method of a typical ceiling baffle installation. The objects were distributed in six rows of two objects each, with rows spaced 813 mm (32 in.) apart and objects in each row spaced 381 mm (15 in.) apart. The width of the installed object array was 4299 mm (169.25 in.) and the length of the installed object array was 2819 mm (111 in.). The area of extended continuous surface attributed to the object array was 16.4 m^2 (176 ft²).

Radial Engineering 2024-12-11

TEST RESULTS

The preferred presentation of sound absorption test results for arrays of spaced objects is sound absorption (m^2) per object and total sound absorption (m^2) at each one-third-octave band

ASTM C423-23 Appendix X2 allows calculation of sound absorption per m^2 (SA/m²) based on the projected horizontal surface area attributable to an array of objects. The extended continuous surface area used in this calculation is to be determined using the following procedure:

 $S_{array} = (w + w_1) \times (l + l_1)$ If the set of objects consists of a rectangular array of equal sized objects with equal space between each object in a row and equal space between rows. (ASTM E423-23 X.2.3.1)

Where:

 S_{array} = area of extended continuous surface attributed to the test specimen, m² w = the measured width of the installed object array, in meters w_l = the space between objects in the array along the width, in meters l = the measured length of the installed object array, in meters l_l = the space between objects in the array along the length, in meters

The sound absorption per m^2 (SA/m²) is calculated based on the following formula:

$$\alpha_{array} = (A_2 - A_1)/S_{array}$$

Where:

 α_{array} = sound absorption per m² (SA/m²) of extended continuous surface, no units, A₁ = absorption of the empty reverberation room, m² and A₂ = absorption of the room after the specimen has been installed, m². S_{array} = area of extended continuous surface attributed to the test specimen, m²
